Abstract

AMG4PSBLAS (ALGEBRAIC MULTIGRID PRECONDITIONERS PACKAGE BASED ON PSBLAS) is a package of parallel algebraic multilevel preconditioners included in the PSCToolkit (Parallel Sparse Computation Toolkit) software framework. It is a progress of a software development project started in 2007, named MLD2P4, which originally implemented a multilevel version of some domain decomposition preconditioners of additive-Schwarz type, and was based on a parallel decoupled version of the well known smoothed aggregation method to generate the multilevel hierarchy of coarser matrices. In the last years, within the context of the EU-H2020 EoCoE project (Energy Oriented Center of Excellence), the package was extended for including new algorithms and functionalities for the setup and application new AMG preconditioners with the final aims of improving efficiency and scalability when tens of thousands cores are used, and of boosting reliability in dealing with general symmetric positive definite linear systems. Due to the significant number of changes and the increase in scope, we decided to rename the package as AMG4PSBLAS.

AMG4PSBLAS has been designed to provide scalable and easy-to-use preconditioners in the context of the PSBLAS (Parallel Sparse Basic Linear Algebra Subprograms) computational framework and can be used in conjuction with the Krylov solvers available in this framework. Our package is based on a completely algebraic approach; therefore users level interfaces assume that the system matrix and preconditioners are represented as PSBLAS distributed sparse matrices. AMG4PSBLAS enables the user to easily specify different features of an algebraic multilevel preconditioner, thus allowing to experiment with different preconditioners for the problem and parallel computers at hand.

The package employs object-oriented design techniques in Fortran 2003, with interfaces to additional third party libraries such as MUMPS, UMFPACK, SuperLU, and SuperLU_Dist, which can be exploited in building multilevel preconditioners. The parallel implementation is based on a Single Program Multiple Data (SPMD) paradigm; the inter-process communication is based on MPI and is managed mainly through PSBLAS.

This guide provides a brief description of the functionalities and the user interface of AMG4PSBLAS.

1 General Overview

The ALGEBRAIC MULTIGRID PRECONDITIONERS PACKAGE BASED ON PSBLAS (AMG-4PSBLAS) provides parallel Algebraic MultiGrid (AMG) preconditioners (see, e.g., [5, 33]), to be used in the iterative solution of linear systems,

$$Ax = b, \tag{1}$$

where *A* is a square, real or complex, sparse symmetric positive definite (s.p.d) matrix.

The preconditioners implemented in AMG4PSBLAS are obtained by combining 3 different types of AMG cycles with smoothers and coarsest-level solvers. Available multigrid cycles include the V-, W-, and a version of a Krylov-type cycle (K-cycle) [5, 29]; they can be combined with Jacobi, hybrid forward/backward Gauss-Seidel, block-Jacobi and additive Schwarz smoothers with various versions of local incomplete factorizations and approximate inverses on the blocks. The Jacobi, block-Jacobi and Gauss-Seidel smoothers are also available in the ℓ_1 version [14].

An algebraic approach is used to generate a hierarchy of coarse-level matrices and operators, without explicitly using any information on the geometry of the original problem, e.g., the discretization of a PDE. To this end, two different coarsening strategies, based on aggregation, are available:

- a decoupled version of the smoothed aggregation procedure proposed in [4, 35], and already included in the previous versions of the package [7, 11];
- a coupled, parallel implementation of the Coarsening based on Compatible Weighted Matching introduced in [12, 13] and described in detail in [14];

Either exact or approximate solvers can be used on the coarsest-level system. We provide interfaces to various parallel and sequential sparse LU factorizations from external packages, sequential native incomplete LU and approximate inverse factorizations, parallel weighted Jacobi, hybrid Gauss-Seidel, block-Jacobi solvers and calls to preconditioned Krylov methods; all smoothers can be also exploited as one-level preconditioners.

AMG4PSBLAS is written in Fortran 2003, following an object-oriented design through the exploitation of features such as abstract data type creation, type extension, functional overloading, and dynamic memory management. The parallel implementation is based on a Single Program Multiple Data (SPMD) paradigm. Single and double precision implementations of AMG4PSBLAS are available for both the real and the complex case, which can be used through a single interface.

AMG4PSBLAS has been designed to implement scalable and easy-to-use multilevel preconditioners in the context of the PSBLAS (Parallel Sparse BLAS) computational framework [23, 22]. PSBLAS provides basic linear algebra operators and data management facilities for distributed sparse matrices, kernels for sequential incomplete factorizations needed for the parallel block-Jacobi and additive Schwarz smoothers, and parallel Krylov solvers which can be used with the AMG4PSBLAS preconditioners. The choice of PSBLAS has been mainly motivated by the need of having a portable

and efficient software infrastructure implementing "de facto" standard parallel sparse linear algebra kernels, to pursue goals such as performance, portability, modularity ed extensibility in the development of the preconditioner package. On the other hand, the implementation of AMG4PSBLAS, which was driven by the need to face the exascale challenge, has led to some important revisions and extentions of the PSBLAS infrastructure. The inter-process comunication required by AMG4PSBLAS is encapsulated in the PSBLAS routines; therefore, AMG4PSBLAS can be run on any parallel machine where PSBLAS implementations are available. In the most recent version of PSBLAS (release 3.7), a plug-in for GPU is included; it includes CUDA versions of main vector operations and of sparse matrix-vector multiplication, so that Krylov methods coupled with AMG4PSBLAS preconditioners relying on Jacobi and block-Jacobi smoothers with sparse approximate inverses on the blocks can be efficiently executed on cluster of GPUs.

AMG4PSBLAS has a layered and modular software architecture where three main layers can be identified. The lower layer consists of the PSBLAS kernels, the middle one implements the construction and application phases of the preconditioners, and the upper one provides a uniform interface to all the preconditioners. This architecture allows for different levels of use of the package: few black-box routines at the upper layer allow all users to easily build and apply any preconditioner available in AMG4PSBLAS; facilities are also available allowing expert users to extend the set of smoothers and solvers for building new versions of the preconditioners (see Section 6).

This guide is organized as follows. General information on the distribution of the source code is reported in Section 2, while details on the configuration and installation of the package are given in Section 3. The basics for building and applying the preconditioners with the Krylov solvers implemented in PSBLAS are reported in Section 4, where the Fortran codes of a few sample programs are also shown. A reference guide for the user interface routines is provided in Section 5. Information on the extension of the package through the addition of new smoothers and solvers is reported in Section 6. The error handling mechanism used by the package is briefly described in Section 7. The copyright terms concerning the distribution and modification of AMG4PSBLAS are reported in Appendix A.

2 Code Distribution

AMG4PSBLAS is available from the web site

https://psctoolkit.github.io/products/amg4psblas/

where contact points for further information can be also found.

The software is available under a modified BSD license, as specified in Appendix A; please note that some of the optional third party libraries may be licensed under a different and more stringent license, most notably the GPL, and this should be taken into account when treating derived works.

The library defines a version string with the constant

amg_version_string_

whose current value is 1.0.

When use the library, please cite the following:

3 Configuring and Building AMG4PSBLAS

In order to build AMG4PSBLAS it is necessary to set up a Makefile with appropriate system-dependent variables; this is done by means of the configure script. The distribution also includes the autoconf and automake sources employed to generate the script, but usually this is not needed to build the software.

AMG4PSBLAS is implemented almost entirely in Fortran 2003, with some interfaces to external libraries in C; the Fortran compiler must support the Fortran 2003 standard plus the extension MOLD= feature, which enhances the usability of ALLOCATE. Most Fortran compilers provide this feature; in particular, this is supported by the GNU Fortran compiler, for which we recommend to use at least version 4.8. The software defines data types and interfaces for real and complex data, in both single and double precision.

Building AMG4PSBLAS requires some base libraries (see Section 3.1); interfaces to optional third-party libraries, which extend the functionalities of AMG4PSBLAS (see Section 3.2), are also available. A number of Linux distributions (e.g., Ubuntu, Fedora, CentOS) provide precompiled packages for the prerequisite and optional software. In many cases these packages are split between a runtime part and a "developer" part; in order to build AMG4PSBLAS you need both. A description of the base and optional software used by AMG4PSBLAS is given in the next sections.

3.1 Prerequisites

The following base libraries are needed:

- BLAS [18, 19, 26] Many vendors provide optimized versions of BLAS; if no vendor version is available for a given platform, the ATLAS software (math-atlas.sourceforge .net) may be employed. The reference BLAS from Netlib (www.netlib.org/blas) are meant to define the standard behaviour of the BLAS interface, so they are not optimized for any particular platform, and should only be used as a last resort. Note that BLAS computations form a relatively small part of the AMG4PSBLAS/-PSBLAS; however they are critical when using preconditioners based on the MUMPS, UMFPACK or SuperLU third party libraries. UMFPACK requires a full LAPACK library; our experience is that configuring ATLAS for building full LA-PACK does not always work in the expected way. Our advice is first to download the LAPACK tarfile from www.netlib.org/lapack and install it independently of ATLAS. In this case, you need to modify the OPTS and NOOPT definitions for including -fPIC compilation option in the make.inc file of the LAPACK library.
- **MPI** [25, 32] A version of MPI is available on most high-performance computing systems.
- **PSBLAS** [21, 23] Parallel Sparse BLAS (PSBLAS) is available from psctoolkit.github.io/ products/psblas/; version 3.7.0 (or later) is required. Indeed, all the prerequisites listed so far are also prerequisites of PSBLAS.

3 CONFIGURING AND BUILDING AMG4PSBLAS

Please note that the four previous libraries must have Fortran interfaces compatible with AMG4PSBLAS; usually this means that they should all be built with the same compiler being used for AMG4PSBLAS.

If you want to use the PSBLAS support for NVIDIA GPUs, you will also need a working version of the CUDA Toolkit that is compatible with the compiler choice made to compile PSBLAS and AMG4PSBLAS. After that you will need to have configured and compiled the PSBLAS library with the options:

./configure --enable-cuda --with-cudadir=\${CUDA_HOME} --with-cudacc=xx,yy,zz

Previous versions required you to have the auxiliary libraries SPGPU and PSBLAS-EXT compiled, this is no longer necessary because they have been integrated into PSBLAS and are compiled by activating the previous flags during configuration. See also Sec 4.2.

3.2 Optional third party libraries

We provide interfaces to the following third-party software libraries; note that these are optional, but if you enable them some defaults for multilevel preconditioners may change to reflect their presence.

- UMFPACK [16] A sparse LU factorization package included in the SuiteSparse library, available from faculty.cse.tamu.edu/davis/suitesparse.html; it provides sequential factorization and triangular system solution for double precision real and complex data. We tested version 4.5.4 of SuiteSparse. Note that for configuring SuiteSparse you should provide the right path to the BLAS and LAPACK libraries in the SuiteSparse_config/SuiteSparse_config.mk file.
- **MUMPS** [2] A sparse LU factorization package available from mumps.enseeiht.fr; it provides sequential and parallel factorizations and triangular system solution for single and double precision, real and complex data. We tested versions 4.10.0 and 5.0.1.
- SuperLU [17] A sparse LU factorization package available from crd.lbl.gov/~xiaoye/ SuperLU/; it provides sequential factorization and triangular system solution for single and double precision, real and complex data. We tested versions 4.3 and 5.0. If you installed BLAS from ATLAS, remember to define the BLASLIB variable in the make.inc file.
- SuperLU_Dist [28] A sparse LU factorization package available from the same site as SuperLU; it provides parallel factorization and triangular system solution for double precision real and complex data. We tested versions 3.3 and 4.2. If you installed BLAS from ATLAS, remember to define the BLASLIB variable in the make.inc file and to add the -std=c99 option to the C compiler options. Note that this library requires the ParMETIS library for parallel graph partitioning and fill-reducing matrix ordering, available from glaros.dtc.umn.edu/gkhome/ metis/parmetis/overview.

3.3 Configuration options

In order to build AMG4PSBLAS, the first step is to use the configure script in the main directory to generate the necessary makefile.

As a minimal example consider the following:

./configure --with-psblas=PSB-INSTALL-DIR

which assumes that the various MPI compilers and support libraries are available in the standard directories on the system, and specifies only the PSBLAS install directory (note that the latter directory must be specified with an *absolute* path). The full set of options may be looked at by issuing the command ./configure --help, which produces:

```
configure' configures AMG4PSBLAS 1.0.0 to adapt to many kinds of systems.
Usage: ./configure [OPTION]... [VAR=VALUE]...
To assign environment variables (e.g., CC, CFLAGS...), specify them as
VAR=VALUE. See below for descriptions of some of the useful variables.
Defaults for the options are specified in brackets.
Configuration:

--help display this help and exit
--help=short display options specific to this package
--help=recursive display the short help of all the included packages

  -h, --help
  -V, --version display version information and exit
  -q, --quiet, --silent do not print `checking ...' messages
      --cache-file=FILE cache test results in FILE [disabled]
  -C, --config-cache alias for `--cache-file=config.cache'
-n, --no-create do not create output files
--srcdir=DIR find the sources in DIR [configure dir or `..']
Installation directories:
  --prefix=PREFIX install architecture-independent files in PREFIX
                           [/usr/local]
  --exec-prefix=EPREFIX install architecture-dependent files in EPREFIX
                            [PREFIX]
By default, `make install' will install all the files in
`/usr/local/bin', `/usr/local/lib' etc. You can specify
an installation prefix other than `/usr/local' using `--prefix',
for instance `--prefix=$HOME'.
For better control, use the options below.
Fine tuning of the installation directories:
  --bindir=DIR
                 user executables [EPREFIX/bin]
 --sbindir=DIR
                    system admin executables [EPREFIX/sbin]
```

3 CONFIGURING AND BUILDING AMG4PSBLAS

```
--libexecdir=DIR
                            program executables [EPREFIX/libexec]
  --sysconfdir=DIR
                            read-only single-machine data [PREFIX/etc]
  --sharedstatedir=DIR modifiable architecture-independent data

→ [PREFIX/com]

  --localstatedir=DIR modifiable single-machine data [PREFIX/var]
                            object code libraries [EPREFIX/lib]
  --libdir=DIR
  --includedir=DIR
                          C header files [PREFIX/include]
  --oldincludedir=DIR C header files for non-gcc [/usr/include]
--datarootdir=DIR read-only arch.-independent data root
  \leftrightarrow [PREFIX/share]
  --datadir=DIR
                           read-only architecture-independent data
                     info documentation [DATAROOTDIR/info]
locale-dependent data [DATAROOTDIR/locale]
man documentation [DATAROOTDIR/man]
documentation root [DATAROOTDIR/doc/amg4psblas]
html documentation [DOCDIR]
dvi documentation [DOCDIR]
  → [DATAROOTDIR]
  --infodir=DIR
  --localedir=DIR
  --mandir=DIR
  --docdir=DIR
  --htmldir=DIR
  --dvidir=DIR
                          dvi documentation [DOCDIR]
                         pdf documentation [DOCDIR]
ps documentation [DOCDIR]
  --pdfdir=DIR
  --psdir=DIR
Program names:
  --program-prefix=PREFIX
                                       prepend PREFIX to installed program
  → names
  --program-suffix=SUFFIX
                                       append SUFFIX to installed program names
  --program-transform-name=PROGRAM run sed PROGRAM on installed program
  \rightarrow names
Optional Features:
  --disable-option-checking ignore unrecognized --enable/--with options
  --disable-FEATURE do not include FEATURE (same as
  \rightarrow --enable-FEATURE=no)
  --enable-FEATURE[=ARG] include FEATURE [ARG=yes]
  --enable-silent-rules less verbose build output (undo: "make V=1")
  --disable-silent-rules verbose build output (undo: "make V=0")
  --enable-dependency-tracking
                            do not reject slow dependency extractors
  --disable-dependency-tracking
                            speeds up one-time build
                            Specify whether to enable a fake mpi library to run
  --enable-serial
                            in serial mode.
Optional Packages:
  --with-PACKAGE[=ARG] use PACKAGE [ARG=ves]
  --without-PACKAGE
                            do not use PACKAGE (same as --with-PACKAGE=no)
  --with-psblas=DIR
                            The install directory for PSBLAS, for example,
                            --with-psblas=/opt/packages/psblas-3.5
  --with-psblas-incdir=DIR
                            Specify the directory for PSBLAS C includes.
```

with-psblas-moddir=DI	
with-psblas-libdir=DI	Specify the directory for PSBLAS Fortran modules.
I	Specify the directory for PSBLAS library.
with-ccopt	additional [CCOPT] flags to be added: will prepend to [CCOPT]
with-fcopt	additional [FCOPT] flags to be added: will prepend to [FCOPT]
with-libs	List additional link flags here. For example, with-libs=-lspecial_system_lib or with-libs=-L/path/to/libs
with-clibs	additional [CLIBS] flags to be added: will prepend to [CLIBS]
with-flibs	additional [FLIBS] flags to be added: will prepend to [FLIBS]
with-library-path	additional [LIBRARYPATH] flags to be added: will prepend to [LIBRARYPATH]
with-include-path	additional [INCLUDEPATH] flags to be added: will prepend to [INCLUDEPATH]
with-module-path	additional [MODULE_PATH] flags to be added: will prepend to [MODULE_PATH]
with-extra-libs	List additional link flags here. For example, with-extra-libs=-lspecial_system_lib or with-extra-libs=-L/path/to/libs
with-blas= <lib></lib>	use BLAS library <lib></lib>
with-blasdir= <dir></dir>	search for BLAS library in <dir></dir>
with-lapack= <lib></lib>	use LAPACK library <lib></lib>
with-mumps=LIBNAME	Specify the libname for MUMPS. Default: autodetect
	with minimum "-lmumps_common -lpord"
with-mumpsdir=DIR	Specify the directory for MUMPS library and includes. Note: you will need to add auxiliary libraries withextra-libs; this depends on how MUMPS was configured and installed, at a minimum → you will need SCALAPACK and BLAS
with-mumpsincdir=DIR	Specify the directory for MUMPS includes.
with-mumpsmoddir=DIR	Specify the directory for MUMPS Fortran modules.
with-mumpslibdir=DIR	Specify the directory for MUMPS library.
with-umfpack=LIBNAME → support	Specify the library name for UMFPACK and its
	libraries. Default: "-lumfpack -lamd"
with-umfpackdir=DIR	Specify the directory for UMFPACK library and includes.
with-umfpackincdir=DI	R
with-umfpacklibdir=DI	Specify the directory for UMFPACK includes. R
with-superlu=LIBNAME	Specify the directory for UMFPACK library. Specify the library name for SUPERLU library. Default: "-lsuperlu"
	۵.

3 CONFIGURING AND BUILDING AMG4PSBLAS

```
Specify the directory for SUPERLU library and
  --with-superludir=DIR
                         includes.
  --with-superluincdir=DIR
                         Specify the directory for SUPERLU includes.
  --with-superlulibdir=DIR
                         Specify the directory for SUPERLU library.
  --with-superludist=LIBNAME
                         Specify the libname for SUPERLUDIST library.
                         Requires you also specify SuperLU. Default:
                         "-lsuperlu_dist"
  --with-superludistdir=DIR
                         Specify the directory for SUPERLUDIST library and
                         includes.
  --with-superludistincdir=DIR
                         Specify the directory for SUPERLUDIST includes.
  --with-superludistlibdir=DIR
                         Specify the directory for SUPERLUDIST library.
Some influential environment variables:
 FC Fortran compiler command
 FCFLAGS
            Fortran compiler flags
 LDFLAGS
            linker flags, e.g. -L<lib dir> if you have libraries in a
            nonstandard directory <lib dir>
             libraries to pass to the linker, e.g. -l<library>
 LIBS
 CC
            C compiler command
 CFLAGS C compiler flags
 CPPFLAGS (Objective) C/C++ preprocessor flags, e.g. -I<include dir> if
            you have headers in a nonstandard directory <include dir>
 MPICC
           MPI C compiler command
 MPIFC
            MPI Fortran compiler command
 CPP
            C preprocessor
Use these variables to override the choices made by `configure' or to help
it to find libraries and programs with nonstandard names/locations.
```

```
Report bugs to <https://github.com/psctoolkit/psctoolkit/issues>.
```

For instance, if a user has built and installed PSBLAS 3.7 under the /opt directory and is using the SuiteSparse package (which includes UMFPACK), then AMG4PSBLAS might be configured with:

```
./configure --with-psblas=/opt/psblas-3.7/

→ --with-umfpackincdir=/usr/include/suitesparse/
```

Once the configure script has completed execution, it will have generated the file Make.inc which will then be used by all Makefiles in the directory tree; this file will be copied in the install directory under the name Make.inc.AMG4PSBLAS.

To use the MUMPS solver package, the user has to add the appropriate options

to the configure script; by default we are looking for the libraries -ldmumps -lsmumps -lzmumps -lcmumps -mumps_common -lpord. MUMPS often uses additional packages such as ScaLAPACK, ParMETIS, SCOTCH, as well as enabling OpenMP; in such cases it is necessary to add linker options with the --with-extra-libs configure option.

To build the library the user will now enter

make

followed (optionally) by

make install

3.4 Bug reporting

If you find any bugs in our codes, please report them through our issues page on

https://github.com/psctoolkit/psctoolkit/issues

To enable us to track the bug, please provide a log from the failing application, the test conditions, and ideally a self-contained test program reproducing the issue.

3.5 Example and test programs

The package contains a samples directory, divided in two subdirs simple and advanced; both of them are further divided into fileread and pdegen subdirectories. Their purpose is as follows:

- simple contains a set of simple example programs with a predefined choice of preconditioners, selectable via integer values. These are intended to get acquainted with the multilevel preconditioners available in AMG4PSBLAS.
- advanced contains a set of more sophisticated examples that will allow the user, via the input files in the runs subdirectories, to experiment with the full range of preconditioners implemented in the package.

The fileread directories contain sample programs that read sparse matrices from files, according to the Matrix Market or the Harwell-Boeing storage format; the pdegen programs generate matrices in full parallel mode from the discretization of a sample partial differential equation.

4 Getting Started

This section describes the basics for building and applying AMG4PSBLAS one-level and multilevel (i.e., AMG) preconditioners with the Krylov solvers included in PSBLAS [21]. The following steps are required:

- Declare the preconditioner data structure. It is a derived data type, amg_xprec_type, where x may be s, d, c or z, according to the basic data type of the sparse matrix (s = real single precision; d = real double precision; c = complex single precision; z = complex double precision). This data structure is accessed by the user only through the AMG4PSBLAS routines, following an object-oriented approach.
- 2. Allocate and initialize the preconditioner data structure, according to a preconditioner type chosen by the user. This is performed by the routine init, which also sets defaults for each preconditioner type selected by the user. The preconditioner types and the defaults associated with them are given in Table 1, where the strings used by init to identify the preconditioner types are also given. Note that these strings are valid also if uppercase letters are substituted by corresponding lowercase ones.
- 3. Modify the selected preconditioner type, by properly setting preconditioner parameters. This is performed by the routine set. This routine must be called if the user wants to modify the default values of the parameters associated with the selected preconditioner type, to obtain a variant of that preconditioner. Examples of use of set are given in Section 4.1; a complete list of all the preconditioner parameters and their allowed and default values is provided in Section 5, Tables 2-8.
- 4. *Build the preconditioner for a given matrix*. If the selected preconditioner is multilevel, then two steps must be performed, as specified next.
 - 4.1 *Build the AMG hierarchy for a given matrix.* This is performed by the routine hierarchy_build.
 - 4.2 *Build the preconditioner for a given matrix.* This is performed by the routine smoothers_build.

If the selected preconditioner is one-level, it is built in a single step, performed by the routine bld.

- 5. Apply the preconditioner at each iteration of a Krylov solver. This is performed by the method apply. When using the PSBLAS Krylov solvers, this step is completely transparent to the user, since apply is called by the PSBLAS routine implementing the Krylov solver (psb_krylov).
- 6. *Free the preconditioner data structure*. This is performed by the routine free. This step is complementary to step 1 and should be performed when the preconditioner is no more used.

All the previous routines are available as methods of the preconditioner object. A detailed description of them is given in Section 5. Examples showing the basic use of AMG4PSBLAS are reported in Section 4.1.

ТҮРЕ	STRING	DEFAULT PRECONDITIONER
No preconditioner	'NONE'	Considered to use the PSBLAS Krylov
		solvers with no preconditioner.
Diagonal	'DIAG',	Diagonal preconditioner. For any zero
	'JACOBI'	diagonal entry of the matrix to be pre-
	'L1-JACOBI'	conditioned, the corresponding entry of
		the preconditioner is set to 1.
Gauss-Seidel	'GS',	Hybrid Gauss-Seidel (forward), that is,
	'L1-GS'	global block Jacobi with Gauss-Seidel as
		local solver.
Symmetrized Gauss-Seidel	'FBGS',	Symmetrized hybrid Gauss-Seidel, that
	'L1-FBGS'	is, forward Gauss-Seidel followed by
		backward Gauss-Seidel.
Block Jacobi	'BJAC',	Block-Jacobi with ILU(0) on the local
	'L1-BJAC'	blocks.
Additive Schwarz	'AS'	Additive Schwarz (AS), with overlap 1
		and ILU(0) on the local blocks.
Multilevel	'ML'	V-cycle with one hybrid forward Gauss-
		Seidel (GS) sweep as pre-smoother and
		one hybrid backward GS sweep as post-
		smoother, decoupled smoothed aggre-
		gation as coarsening algorithm, and LU
		(plus triangular solve) as coarsest-level
		solver. See the default values in Tables 2-
		8 for further details of the preconditioner.

Table 1: Preconditioner types, corresponding strings and default choices.

Note that the module amg_prec_mod, containing the definition of the preconditioner data type and the interfaces to the routines of AMG4PSBLAS, must be used in any program calling such routines. The modules psb_base_mod, for the sparse matrix and communication descriptor data types, and psb_krylov_mod, for interfacing with the Krylov solvers, must be also used (see Section 4.1).

Remark 1. Coarsest-level solvers based on the LU factorization, such as those implemented in UMFPACK, MUMPS, SuperLU, and SuperLU_Dist, usually lead to smaller numbers of preconditioned Krylov iterations than inexact solvers, when the linear system comes from a standard discretization of basic scalar elliptic PDE problems. However, this does not necessarily correspond to the shortest execution time on

4 Getting Started

parallel computers.

4.1 Examples

The code reported in Figure 1 shows how to set and apply the default multilevel preconditioner available in the real double precision version of AMG4PSBLAS (see Table 1). This preconditioner is chosen by simply specifying 'ML' as the second argument of P%init (a call to P%set is not needed) and is applied with the CG solver provided by PSBLAS (the matrix of the system to be solved is assumed to be positive definite). As previously observed, the modules psb_base_mod, amg_prec_mod and psb_krylov_mod must be used by the example program.

The part of the code dealing with reading and assembling the sparse matrix and the right-hand side vector and the deallocation of the relevant data structures, performed through the PSBLAS routines for sparse matrix and vector management, is not reported here for the sake of conciseness. The complete code can be found in the example program file amg_dexample_ml.f90, in the directory samples/simple/fileread of the AMG4PSBLAS implementation (see Section 3.5). A sample test problem along with the relevant input data is available in samples/simple/fileread/runs. For details on the use of the PSBLAS routines, see the PSBLAS User's Guide [21].

The setup and application of the default multilevel preconditioner for the real single precision and the complex, single and double precision, versions are obtained with straightforward modifications of the previous example (see Section 5 for details). If these versions are installed, the corresponding codes are available in samples/simple/file-read.

Different versions of the multilevel preconditioner can be obtained by changing the default values of the preconditioner parameters. The code reported in Figure 2 shows how to set a V-cycle preconditioner which applies 1 block-Jacobi sweep as preand post-smoother, and solves the coarsest-level system with 8 block-Jacobi sweeps. Note that the ILU(0) factorization (plus triangular solve) is used as local solver for the block-Jacobi sweeps, since this is the default associated with block-Jacobi and set by P%init. Furthermore, specifying block-Jacobi as coarsest-level solver implies that the coarsest-level matrix is distributed among the processes. Figure 3 shows how to set a W-cycle preconditioner using the Coarsening based on Compatible Weighted Matching, aggregates of size at most 8 and smoothed prolongators. It applies 2 hybrid Gauss-Seidel sweeps as pre- and post-smoother, and solves the coarsest-level system with the parallel flexible Conjugate Gradient method (KRM) coupled with the block-Jacobi preconditioner having ILU(0) on the blocks. Default parameters are used for stopping criterion of the coarsest solver. Note that, also in this case, specifying KRM as coarsest-level solver implies that the coarsest-level matrix is distributed among the processes.

The code fragments shown in Figures 2 and 3 are included in the example program file amg_dexample_ml.f90 too.

Finally, Figure 4 shows the setup of a one-level additive Schwarz preconditioner, i.e., RAS with overlap 2. Note also that a Krylov method different from CG must be

4.2 GPU example

The code discussed here shows how to set up a program exploiting the combined GPU capabilities of PSBLAS and AMG4PSBLAS. The code example is available in the source distribution directory amg4psblas/examples/gpu.

First of all, we need to include the appropriate modules and declare some auxiliary variables: In this particular example we are choosing to employ a HLG data structure for sparse matrices on GPUs; for more information please refer to the PSBLAS-EXT users' guide.

```
! build a one-level RAS with overlap 2 and ILU(0) on the local blocks.
call P%init(ctxt,'AS',info)
call P%set('SUB_OVR',2,info)
call P%build(A,desc_A,info)
... ...
! solve Ax=b with preconditioned BiCGSTAB
call psb_krylov('BICGSTAB',A,P,b,x,tol,desc_A,info)
```

Listing 4: setup of a one-level Schwarz preconditioner.

```
program amg_dexample_gpu
use psb_base_mod
use amg_prec_mod
use psb_krylov_mod
use psb_util_mod
use psb_gpu_mod
use data_input
use amg_d_pde_mod
implicit none
......
! GPU variables
type(psb_d_hlg_sparse_mat) :: agmold
type(psb_d_vect_gpu) :: vgmold
type(psb_i_vect_gpu) :: igmold
```

Listing 5: setup of a GPU-enabled test program part one.

We then have to initialize the GPU environment, and pass the appropriate MOLD variables to the build methods (see also the PSBLAS and PSBLAS-EXT users' guides). Finally, we convert the input matrix, the descriptor and the vectors to use a GPU-enabled internal storage format. We then preallocate the preconditioner workspace before entering the Krylov method. At the end of the code, we close the GPU environment

It is very important to employ smoothers and coarsest solvers that are suited to the GPU, i.e. methods that do NOT employ triangular system solve kernels. Methods that satisfy this constraint include:

- JACOBI
- BJAC with the following methods on the local blocks:
 - INVK
 - INVT
 - AINV

and their ℓ_1 variants.

Listing 6: setup of a GPU-enabled test program part two.

```
call desc_a%cnv(mold=igmold)
call a%cscnv(info,mold=agmold)
call psb_geasb(x,desc_a,info,mold=vgmold)
call psb_geasb(b,desc_a,info,mold=vgmold)

! iterative method parameters
1
call psb_barrier(ctxt)
call prec%allocate_wrk(info)
t1 = psb_wtime()
call psb_krylov(s_choice%kmethd,a,prec,b,x,s_choice%eps,&
     & desc_a, info, itmax=s_choice%itmax, iter=iter, err=err, &
     & itrace=s_choice%itrace,&
    & istop=s_choice%istopc,irst=s_choice%irst)
call prec%deallocate_wrk(info)
call psb_barrier(ctxt)
tslv = psb_wtime() - t1
. . . . . .
call psb_gpu_exit()
call psb_exit(ctxt)
stop
```

Listing 7: setup of a GPU-enabled test program part three.

5 User Interface

The basic user interface of AMG4PBLAS consists of eight methods. The six methods init, set, build, hierarchy_build, smoothers_build and apply encapsulate all the functionalities for the setup and the application of any multilevel and one-level preconditioner implemented in the package. The method free deallocates the preconditioner data structure, while descr prints a description of the preconditioner setup by the user. For backward compatibility, methods are also accessible as stand-alone subroutines.

For each method, the same user interface is overloaded with respect to the real/complex and single/double precision data; arguments with appropriate data types must be passed to the method, i.e.,

- the sparse matrix data structure, containing the matrix to be preconditioned, must be of type psb_xspmat_type with x = s for real single precision, x = d for real double precision, x = c for complex single precision, x = z for complex double precision;
- the preconditioner data structure must be of type amg_xprec_type, with x = s, d, c, z, according to the sparse matrix data structure;
- the arrays containing the vectors v and w involved in the preconditioner application w = B⁻¹v must be of type psb_xvect_type with x = s, d, c, z, in a manner completely analogous to the sparse matrix type;
- real parameters defining the preconditioner must be declared according to the precision of the sparse matrix and preconditioner data structures (see Section 5.2).

A description of each method is given in the remainder of this section.

5 USER INTERFACE

5.1 Method init

call p%init(contxt,ptype,info)

This method allocates and initializes the preconditioner p, according to the preconditioner type chosen by the user.

Arguments

contxt	<pre>type(psb_ctxt_type), intent(in).</pre>
	The communication context.
ptype	<pre>character(len=*), intent(in).</pre>
	The type of preconditioner. Its values are specified in Table 1.
	Note that strings are case insensitive.
info	<pre>integer, intent(out).</pre>
	Error code. If no error, 0 is returned. See Section 7 for details.

5.2 Method set

call p%set(what,val,info [,ilev, ilmax, pos, idx])

This method sets the parameters defining the preconditioner p. More precisely, the parameter identified by what is assigned the value contained in val.

Arguments

what	<pre>character(len=*).</pre>
	The parameter to be set. It can be specified through its name; the string
_	is case-insensitive. See Tables 2-8.
val	<pre>integer or character(len=*) or real(psb_spk_) or real(psb_dpk_),</pre>
	intent(in).
	The value of the parameter to be set. The list of allowed values and the
	corresponding data types is given in Tables 2-8. When the value is of
	type <pre>character(len=*), it is also treated as case insensitive.</pre>
info	<pre>integer, intent(out).</pre>
	Error code. If no error, 0 is returned. See Section 7 for details.
ilev	<pre>integer, optional, intent(in).</pre>
	For the multilevel preconditioner, the level at which the preconditioner
	parameter has to be set. The levels are numbered in increasing order
	starting from the finest one, i.e., level 1 is the finest level. If ilev is
	not present, the parameter identified by what is set at all levels that are
	appropriate (see Tables 2-8).
ilmax	integer, optional, intent(in).
	For the multilevel preconditioner, when both ilev and ilmax are present,
	the settings are applied at all levels ilev:ilmax. When ilev is present
	but ilmax is not, then the default is ilmax=ilev. The levels are num-
	bered in increasing order starting from the finest one, i.e., level 1 is the
	finest level.
pos	<pre>character(len=*), optional, intent(in).</pre>
-	Whether the other arguments apply only to the pre-smoother ('PRE') or
	to the post-smoother ('POST'). If pos is not present, the other arguments
	are applied to both smoothers. If the preconditioner is one-level or the
	parameter identified by what does not concern the smoothers, pos is
	ignored.
idx	integer, optional, intent(in).
	An auxiliary input argument that can be passed to the underlying ob-
	jects.

A variety of preconditioners can be obtained by setting the appropriate preconditioner parameters. These parameters can be logically divided into four groups, i.e., parameters defining

1. the type of multilevel cycle and how many cycles must be applied;

5 USER INTERFACE

- 2. the coarsening algorithm;
- 3. the solver at the coarsest level (for multilevel preconditioners only);
- 4. the smoother of the multilevel preconditioners, or the one-level preconditioner.

A list of the parameters that can be set, along with their allowed and default values, is given in Tables 2-8.

Remark 2. A smoother is usually obtained by combining two objects: a smoother ('SMOOTHER_TYPE') and a local solver ('SUB_SOLVE'), as specified in Tables 7-9. For example, the block-Jacobi smoother using ILU(0) on the blocks is obtained by combining the block-Jacobi smoother object with the ILU(0) solver object. Similarly, the hybrid Gauss-Seidel smoother (see Note in Table 7) is obtained by combining the block-Jacobi smoother object with a single sweep of the Gauss-Seidel solver object, while the point-Jacobi smoother is the result of combining the block-Jacobi smoother object with a single sweep of the smoother object with a single sweep of the solver object. In the same way are obtained the ℓ_1 -versions of the smoothers. However, for simplicity, shortcuts are provided to set all versions of point-Jacobi, hybrid (forward) Gauss-Seidel, and hybrid backward Gauss-Seidel, i.e., the previous smoothers can be defined just by setting 'SMOOTHER_TYPE' to certain specific values (see Tables 7), without the need to set 'SUB_SOLVE' as well.

The smoother and solver objects are arranged in a hierarchical manner. When specifying a smoother object, its parameters, including the local solver, are set to their default values, and when a solver object is specified, its defaults are also set, overriding in both cases any previous settings even if explicitly specified. Therefore if the user sets a smoother, and wishes to use a solver different from the default one, the call to set the solver must come *after* the call to set the smoother.

Similar considerations apply to the point-Jacobi, Gauss-Seidel and block-Jacobi coarsest-level solvers, and shortcuts are available in this case too (see Table 5).

Remark 3. The polynomial-accelerated smoother described in Tables 7 and 9 redefines a sweep or iteration as corresponding to the degree of the polynomial used. Consequently, the 'SMOOTHER_SWEEPS' option is overridden by the 'POLY_DEGREE' option. This smoother is paired with a base smoother object, whose iterations are accelerated using the specified polynomial smoothing technique. By default, the ℓ_1 -Jacobi smoother serves as the base smoother, offering theoretical guarantees on the resulting convergence factor [15, 27]. Alternative combinations are experimental and lack established guarantees.

Remark 4. Many of the coarsest-level solvers apply to a specific coarsest-matrix layout; therefore, setting the solver after the layout may change the layout to either distributed or replicated. Similarly, setting the layout after the solver may change the solver.

More precisely, UMFPACK and SuperLU require the coarsest-level matrix to be replicated, while SuperLU_Dist and KRM require it to be distributed. In these cases,

setting the coarsest-level solver implies that the layout is redefined according to the solver, ovverriding any previous settings. MUMPS, point-Jacobi, hybrid Gauss-Seidel and block-Jacobi can be applied to replicated and distributed matrices, thus their choice does not modify any previously specified layout. It is worth noting that, when the matrix is replicated, the point-Jacobi, hybrid Gauss-Seidel and block-Jacobi solvers and their ℓ_1 – versions reduce to the corresponding local solver objects (see Remark 2). For the point-Jacobi and Gauss-Seidel solvers, these objects correspond to a *single* point-Jacobi sweep and a *single* Gauss-Seidel sweep, respectively, which are very poor solvers.

On the other hand, the distributed layout can be used with any solver but UMFPACK and SuperLU; therefore, if any of these two solvers has already been selected, the coarsest-level solver is changed to block-Jacobi, with the previously chosen solver applied to the local blocks. Likewise, the replicated layout can be used with any solver but SuperLu_Dist and KRM; therefore, if SuperLu_Dist or KRM have been previously set, the coarsest-level solver is changed to the default sequential solver.

In a parallel setting with many cores, we suggest to the users to change the default coarsest solver for using the KRM choice, i.e. a parallel distributed iterative solution of the coarsest system based on Krylov methods.

Remark 4. The argument idx can be used to allow finer control for those solvers; for instance, by specifying the keyword 'MUMPS_IPAR_ENTRY' and an appropriate value for idx, it is possible to set any entry in the MUMPS integer control array. See also Sec. 6.

5.3 Method hierarchy_build

call p%hierarchy_build(a,desc_a,info)

This method builds the hierarchy of matrices and restriction/prolongation operators for the multilevel preconditioner p, according to the requirements made by the user through the methods init and set.

a	<pre>type(psb_xspmat_type), intent(in).</pre>
	The sparse matrix structure containing the local part of the matrix
	to be preconditioned. Note that <i>x</i> must be chosen according to the
	real/complex, single/double precision version of AMG4PSBLAS un-
	der use. See the PSBLAS User's Guide for details [21].
desc_a	<pre>type(psb_desc_type), intent(in).</pre>
	The communication descriptor of a. See the PSBLAS User's Guide for
	details [21].
info	integer, intent(out).
	Error code. If no error, 0 is returned. See Section 7 for details.

5.4 Method smoothers_build

call p%smoothers_build(a,desc_a,p,info[,amold,vmold,imold])

This method builds the smoothers and the coarsest-level solvers for the multilevel preconditioner p, according to the requirements made by the user through the methods init and set, and based on the aggregation hierarchy produced by a previous call to hierarchy_build (see Section 5.3).

a	<pre>type(psb_xspmat_type), intent(in).</pre>
	The sparse matrix structure containing the local part of the matrix
	to be preconditioned. Note that <i>x</i> must be chosen according to the
	real/complex, single/double precision version of AMG4PSBLAS un-
	der use. See the PSBLAS User's Guide for details [21].
desc_a	<pre>type(psb_desc_type), intent(in).</pre>
	The communication descriptor of a. See the PSBLAS User's Guide for
	details [21].
info	<pre>integer, intent(out).</pre>
	Error code. If no error, 0 is returned. See Section 7 for details.
amold	class(psb_x_base_sparse_mat), intent(in), optional.
	The desired dynamic type for internal matrix components; this allows
	e.g. running on GPUs; it needs not be the same on all processes. See the
	PSBLAS User's Guide for details [21].
vmold	<pre>class(psb_x_base_vect_type), intent(in), optional.</pre>
	The desired dynamic type for internal vector components; this allows
	e.g. running on GPUs.
imold	<pre>class(psb_i_base_vect_type), intent(in), optional.</pre>
	The desired dynamic type for internal integer vector components; this
	allows e.g. running on GPUs.

5.5 Method build

call p%build(a,desc_a,info[,amold,vmold,imold])

This method builds the preconditioner p according to the requirements made by the user through the methods init and set (see Sections 5.3 and 5.4 for multilevel preconditioners). It is mostly provided for backward compatibility; indeed, it is internally implemented by invoking the two previous methods hierarchy_build and smoothers_build, whose nomenclature would however be somewhat unnatural when dealing with simple one-level preconditioners.

Arguments

а	<pre>type(psb_xspmat_type), intent(in).</pre>
	The sparse matrix structure containing the local part of the matrix
	to be preconditioned. Note that <i>x</i> must be chosen according to the
	real/complex, single/double precision version of AMG4PSBLAS un-
	der use. See the PSBLAS User's Guide for details [21].
desc_a	<pre>type(psb_desc_type), intent(in).</pre>
	The communication descriptor of a. See the PSBLAS User's Guide for
	details [21].
info	<pre>integer, intent(out).</pre>
	Error code. If no error, 0 is returned. See Section 7 for details.
amold	<pre>class(psb_x_base_sparse_mat), intent(in), optional.</pre>
	The desired dynamic type for internal matrix components; this allows
	e.g. running on GPUs; it needs not be the same on all processes. See the
	PSBLAS User's Guide for details [21].
vmold	<pre>class(psb_x_base_vect_type), intent(in), optional.</pre>
	The desired dynamic type for internal vector components; this allows
	e.g. running on GPUs.
imold	<pre>class(psb_i_base_vect_type), intent(in), optional.</pre>
	The desired dynamic type for internal integer vector components; this
	allows e.g. running on GPUs.
.1 1	

The method can be used to build multilevel preconditioners too.

5.6 Method apply

call p%apply(x,y,desc_a,info [,trans,work])

This method computes $y = op(B^{-1})x$, where *B* is a previously built preconditioner, stored into p, and *op* denotes the preconditioner itself or its transpose, according to the value of trans. Note that, when AMG4PSBLAS is used with a Krylov solver from PSBLAS, p%apply is called within the PSBLAS method psb_krylov and hence it is completely transparent to the user.

x	<i>type</i> (kind_parameter), dimension(:), intent(in)—.
	The local part of the vector <i>x</i> . Note that <i>type</i> and <i>kind_parameter</i> must be
	chosen according to the real/complex, single/double precision version
	of AMG4PSBLAS under use.
У	<i>type</i> (kind_parameter), dimension(:), intent(out)—.
	The local part of the vector <i>y</i> . Note that <i>type</i> and <i>kind_parameter</i> must be
	chosen according to the real/complex, single/double precision version
	of AMG4PSBLAS under use.
desc_a	<pre>type(psb_desc_type), intent(in).</pre>
	The communication descriptor associated to the matrix to be precondi-
	tioned.
info	<pre>integer, intent(out).</pre>
	Error code. If no error, 0 is returned. See Section 7 for details.
trans	<pre>character(len=1), optional, intent(in).</pre>
	If trans = 'N', 'n' then $op(B^{-1}) = B^{-1}$; if trans = 'T', 't' then
	$op(B^{-1}) = B^{-T}$ (transpose of B^{-1}); if trans = 'C', 'c' then $op(B^{-1}) =$
	B^{-C} (conjugate transpose of B^{-1}).
work	<i>type</i> (kind_parameter), dimension(:), optional, target—.
	Workspace. Its size should be at least 4 * psb_cd_get_local_
	cols(desc_a) (see the PSBLAS User's Guide). Note that type and
	kind_parameter must be chosen according to the real/complex, sin-
	gle/double precision version of AMG4PSBLAS under use.

5.7 Method free

call p%free(p,info)

This method deallocates the preconditioner data structure p.

Arguments

info integer, intent(out). Error code. If no error, 0 is returned. See Section 7 for details.

5.8 Method descr

call p%descr(info, [iout, root, verbosity])

This method prints a description of the preconditioner p to the standard output or to a file. It must be called after hierachy_build and smoothers_build, or build, have been called.

Arguments

info	<pre>integer, intent(out).</pre>
	Error code. If no error, 0 is returned. See Section 7 for details.
iout	<pre>integer, intent(in), optional.</pre>
	The id of the file where the preconditioner description will be
	printed; the default is the standard output.
root	<pre>integer, intent(in), optional.</pre>
	The id of the process where the preconditioner description will be
	printed; the default is psb_root
verbosity	integer, intent(in), optional.
	The verbosity level of the description. Default value is 0. For
	values higher than 0, it prints out further information, e.g., for a
	distributed multilevel preconditioner the size of the coarse matri-
	ces on every process.

5.9 Auxiliary Methods

Various functionalities are implemented as additional methods of the preconditioner object.

5.9.1 Method: dump

call p%dump(info[,istart,iend,prefix,head,ac,rp,smoother,solver,global_num])

Dump on file.

info	<pre>integer, intent(out).</pre>
	Error code. If no error, 0 is returned. See Section 7 for details.
amold	<pre>class(psb_x_base_sparse_mat), intent(in), optional.</pre>
	The desired dynamic type for internal matrix components; this allows
	e.g. running on GPUs; it needs not be the same on all processes. See the
	PSBLAS User's Guide for details [21].

5.9.2 Method: clone

call p%clone(pout,info)

Create a (deep) copy of the preconditioner object.

Arguments

pout	<pre>type(amg_xprec_type), intent(out).</pre>
	The copy of the preconditioner data structure. Note that x must be
	chosen according to the real/complex, single/double precision version
	of AMG4PSBLAS under use.
info	<pre>integer, intent(out).</pre>
	Error code. If no error, 0 is returned. See Section 7 for details.

5.9.3 Method: sizeof

sz = p%sizeof([global])

global logical, optional.

Whether the global or local preconditioner memory occupation is desired. Default: .false..

Return memory footprint in bytes.

5.9.4 Method: allocate_wrk

call p%allocate_wrk(info[, vmold])

Allocate internal work vectors. Each application of the preconditioner uses a number of work vectors which are allocated internally as necessary; therefore allocation and deallocation of memory occurs multiple times during the execution of a Krylov method. In most cases this strategy is perfectly acceptable, but on some platforms, most notably GPUs, memory allocation is a slow operation, and the default behaviour would lead to a slowdown. This method allows to trade space for time by preallocating the internal workspace outside of the invocation of a Krylov method. When using GPUs or other specialized devices, the vmold argument is also necessary to ensure the internal work vectors are of the appropriate dynamic type to exploit the accelerator hardware; when allocation occurs internally this is taken care of based on the dynamic type of the x argument to the apply method.

info	integer, intent(out).
	Error code. If no error, 0 is returned. See Section 7 for details.
vmold	<pre>class(psb_x_base_vect_type), intent(in), optional.</pre>
	The desired dynamic type for internal vector components; this allows
	e.g. running on GPUs.

5 USER INTERFACE

5.9.5 Method: deallocate_wrk

call p%deallocate_wrk(info)

Deallocate internal work vectors.

Arguments

info

integer, intent(out).
Error code. If no error, 0 is returned. See Section 7 for details.

6 Adding new smoother and solver objects to AMG4PSBLAS

Developers can add completely new smoother and/or solver classes derived from the base objects in the library (see Remark 2 in Section 5.2), without recompiling the library itself.

To do so, it is necessary first to select the base type to be extended. In our experience, it is quite likely that the new application needs only the definition of a "solver" object, which is almost always acting only on the local part of the distributed matrix. The parallel actions required to connect the various solver objects are most often already provided by the block-Jacobi or the additive Schwarz smoothers. To define a new solver, the developer will then have to define its components and methods, perhaps taking one of the predefined solvers as a starting point, if possible.

Once the new smoother/solver class has been developed, to use it in the context of the multilevel preconditioners it is necessary to:

- declare in the application program a variable of the new type;
- pass that variable as the argument to the set routine as in the following:

call p%set(smoother,info [,ilev,ilmax,pos])
call p%set(solver,info [,ilev,ilmax,pos])

• link the code implementing the various methods into the application executable.

The new solver object is then dynamically included in the preconditioner structure, and acts as a *mold* to which the preconditioner will conform, even though the AMG4PSBLAS library has not been modified to account for this new development.

It is possible to define new values for the keyword WHAT in the set routine; if the library code does not recognize a keyword, it passes it down the composition hierarchy (levels containing smoothers containing in turn solvers), so that it can eventually be caught by the new solver. By the same token, any keyword/value pair that does not pertain to a given smoother should be passed down to the contained solver, and any keyword/value pair that does not pertain to a given solver is by default ignored.

An example is provided in the source code distribution under the folder tests/newslv. In this example we are implementing a new incomplete factorization variant (which is simply the ILU(0) factorization under a new name). Because of the specifics of this case, it is possible to reuse the basic structure of the ILU solver, with its L/D/U components and the methods needed to apply the solver; only a few methods, such as the description and most importantly the build, need to be ovverridden (rewritten).

The interfaces for the calls shown above are defined using

${\tt smoother}$	<pre>class(amg_x_base_smoother_type)</pre>
	The user-defined new smoother to be employed in the preconditioner.
solver	<pre>class(amg_x_base_solver_type)</pre>
	The user-defined new solver to be employed in the preconditioner.

5 USER INTERFACE

The other arguments are defined in the way described in Sec. 5.2. As an example, in the tests/newslv code we define a new object of type amg_d_tlu_solver_type, and we pass it as follows:

```
! sparse matrix and preconditioner
type(psb_dspmat_type) :: a
type(amg_dprec_type) :: prec
type(amg_d_tlu_solver_type) :: tlusv
. . . . . .
!
! prepare the preconditioner: an ML with defaults, but with TLU solver at
! intermediate levels. All other parameters are at default values.
1
call prec%init('ML',
                          info)
call prec%hierarchy_build(a,desc_a,info)
nlv = prec%get_nlevs()
call prec%set(tlusv,
                     info,ilev=1,ilmax=max(1,nlv-1))
call prec%smoothers_build(a,desc_a,info)
```

7 Error Handling

The error handling in AMG4PSBLAS is based on the PSBLAS error handling. Error conditions are signaled via an integer argument info; whenever an error condition is detected, an error trace stack is built by the library up to the top-level, user-callable routine. This routine will then decide, according to the user preferences, whether the error should be handled by terminating the program or by returning the error condition to the user code, which will then take action, and whether an error message should be printed. These options may be set by using the PSBLAS error handling routines; for further details see the PSBLAS User's Guide [21].

B Contributor Covenant Code of Conduct

Our Pledge We as members, contributors, and leaders pledge to make participation in our community a harassment-free experience for everyone, regardless of age, body size, visible or invisible disability, ethnicity, sex characteristics, gender identity and expression, level of experience, education, socio-economic status, nationality, personal appearance, race, caste, color, religion, or sexual identity and orientation. We pledge to act and interact in ways that contribute to an open, welcoming, diverse, inclusive, and healthy community. Our Standards Examples of behavior that contributes to a positive environment for our community include:

- Demonstrating empathy and kindness toward other people
- Being respectful of differing opinions, viewpoints, and experiences
- Giving and gracefully accepting constructive feedback
- Accepting responsibility and apologizing to those affected by our mistakes, and learning from the experience
- Focusing on what is best not just for us as individuals, but for the overall community

Examples of unacceptable behavior include:

- The use of sexualized language or imagery, and sexual attention or advances of any kind
- Trolling, insulting or derogatory comments, and personal or political attacks
- Public or private harassment
- Publishing others' private information, such as a physical or email address, without their explicit permission
- Other conduct which could reasonably be considered inappropriate in a professional setting

Enforcement Responsibilities Community leaders are responsible for clarifying and enforcing our standards of acceptable behavior and will take appropriate and fair corrective action in response to any behavior that they deem inappropriate, threatening, offensive, or harmful. Community leaders have the right and responsibility to remove, edit, or reject comments, commits, code, wiki edits, issues, and other contributions that are not aligned to this Code of Conduct, and will communicate reasons for moderation decisions when appropriate. Scope This Code of Conduct applies within all community spaces, and also applies when an individual is officially representing the community in public spaces. Examples of representing our community include using an official e-mail address, posting via an official social media account, or acting as an appointed

representative at an online or offline event. Enforcement Instances of abusive, harassing, or otherwise unacceptable behavior may be reported to the community leaders responsible for enforcement at eocoe@na.iac.cnr.it. All complaints will be reviewed and investigated promptly and fairly. All community leaders are obligated to respect the privacy and security of the reporter of any incident.

Enforcement Guidelines Community leaders will follow these Community Impact Guidelines in determining the consequences for any action they deem in violation of this Code of Conduct:

1. Correction

Community Impact: Use of inappropriate language or other behavior deemed unprofessional or unwelcome in the community.

Consequence: A private, written warning from community leaders, providing clarity around the nature of the violation and an explanation of why the behavior was inappropriate. A public apology may be requested.

2. Warning

Community Impact: A violation through a single incident or series of actions.

Consequence: A warning with consequences for continued behavior. No interaction with the people involved, including unsolicited interaction with those enforcing the Code of Conduct, for a specified period of time. This includes avoiding interactions in community spaces as well as external channels like social media. Violating these terms may lead to a temporary or permanent ban.

3. Temporary Ban

Community Impact: A serious violation of community standards, including sustained inappropriate behavior.

Consequence: A temporary ban from any sort of interaction or public communication with the community for a specified period of time. No public or private interaction with the people involved, including unsolicited interaction with those enforcing the Code of Conduct, is allowed during this period. Violating these terms may lead to a permanent ban.

4. Permanent Ban

Community Impact: Demonstrating a pattern of violation of community standards, including sustained inappropriate behavior, harassment of an individual, or aggression toward or disparagement of classes of individuals.

Consequence: A permanent ban from any sort of public interaction within the community.

Attribution This Code of Conduct is adapted from the Contributor Covenant, version 2.0, available at https://www.contributor-covenant.org/version/2/0/code_of_conduct .html. Community Impact Guidelines were inspired by Mozilla's code of conduct enforcement ladder. For answers to common questions about this code of conduct, see the FAQ at https://www.contributor-covenant.org/faq. Translations are available at https://www.contributor-covenant.org/translations.
